

STELLA Reverse Osmosis

“SAY GOODBYE TO FLUORIDE WITH THE STELLA REVERSE OSMOSIS UNIT”

The reverse osmosis process transforms tap water into high quality water, such as bottled water. Its operating principle is the same as the one in our organism, where water is distributed by natural osmosis, throwing away impurities and making water beneficial for our organism. This process lies in making water go through pre-filters, post-filters and a semi-permeable membrane, whose function is to retain the high concentration of dissolved salts present in water. This allows us to obtain high quality water with a pure taste at the osmosis outlet.

The STELLA can be used for cooking and washing fruit, making coffee or tea, preparing feeding bottles, making ice cubes, for steam irons, aquariums, delicate plants, etc. You can choose the most appropriate use in every situation

STELLA has been completely built using plastic materials, thus preventing the deterioration of steel due to humidity.

Installation of the STELLA;

STELLA reverse osmosis is a complete and compact system which can be easily installed in your kitchen. It can be integrated inside the cupboards, therefore it has no effect on the kitchen's design.

Dimensions of the STELLA; 365 high, 410 wide and 250 deep.

Main Features;

- Re-mineral filter as standard.
- Anti Rust – Highly resistant plastic housing
- Green Filter Membrane
- CE Certificate
- Ecological - Control system for a reduced water consumption

REMOVES;

Reverse Osmosis successfully treats water and removes odours, colours and heavy sediments, while also removing metals such as aluminium, arsenic, barium, chlorine, copper, fluoride, herbicides, lead, mercury, nitrate, pesticides, selenium, silver, sulphate, Trihalomethanes and cryptosporidium..
